

Datapult

In today's information-driven business world, the ability to seamlessly transfer and replicate data to and from the cloud can mean the difference between getting along and getting ahead. For example, despite their benefits, many organizations are still hesitant to adopt software-as-a-service (SaaS) offerings. Chief among their concerns is the difficulty in integrating their existing data sources into these new, on-demand software services.

While this may be a real challenge for some large enterprises that must contend with a wide range of custom applications, adoption of SaaS solutions is becoming less of an issue for more and more companies who use relatively common applications and database structures. For these organizations, data replication provides increased local control and the ability to run complex or ad hoc analytical queries across the entire data set without transmitting all of that data across the Internet.

Datapult is an on-demand data replicator providing fast, reliable, secure and cost-effective cloud-to-enterprise data integration that enables organizations to quickly and easily replicate SaaS-related data to their on-premise transactional and master databases. Datapult helps organizations store and maintain local, separate copies of their **ServiceNow**, **Salesforce** or other SaaS data for specialized uses. It can be leveraged for data warehousing, data mining, custom reporting, analytics, and integration with other enterprise applications, such as SalesForce.

Datapult

Powered by XCELNET System Inc.

Datapult's user interface helps ServiceNow administrators and business to selectively or entirely download data for archiving or reporting needs. This capability can be leveraged to clone or mirror production databases for offline, ad hoc business reporting.

Features

Key features of the Datapult Data Replicator solution include:

- ❖ Ability to:
 - Replicate databases selectively or entirely
 - Perform ad hoc reporting on local database snapshots
 - Back up and archive **ServiceNow** databases
 - Track history of archives and snapshots
- ❖ Secure authentication
- ❖ Industry-leading service and support
- ❖ Graphical User Interface for replication

Benefits

Key benefits of the Datapult Data Replicator solution include:

- ✓ Integrate Servicenow Cloud data for enterprise business reporting
- ✓ Database snapshots available anytime
- ✓ Ease of use
- ✓ Time-to-Value
- ✓ Low Operational Cost

Datapult currently supports **Oracle, MySQL, MSSQL and Postgres** databases.
